

Member Guide

Every handshake, indexed. How to set up your card, capture the room, and follow up by segment.

Version 0.8, September 2026. Web app. The iOS app follows the same screens.

What Goldex is

Goldex is a private contact index with a card on the front. Your card opens by NFC tap, QR scan, or link. The person you meet saves you to their phone in one press, then tells you who they are in their own words. Goldex files them under the right name, role, city, and company, and adds them to the event you met at. Later, you filter your index by any column and follow up with the exact group you want, by email, by text from your own phone, or by iMessage on the Events plan.

Three moves

- Share the card: tap, scan, or link.
- Learn who they are: they type or speak a note; Goldex files it.
- Follow up by segment: filter, then message everyone in the filter.

1. Your first five minutes

- Create an account (email, Apple, or Google). Onboarding asks for your name, title, company, and a photo, then opens the Card Builder with your details filled in.
- Publish the card. You get a link (goldex.link/yourname/card) and a QR code. Both work immediately.
- Open Settings and add your phone, socials, booking link, and any extra fields (a second website, Cash App, press kit). Each extra field can be shown on any card.
- Order NFC stickers, or write the link to a blank NTAG213 sticker with "Write to my own sticker." Any sticker you own can point at any card, and you can re-aim it later.

2. Cards

Your cards are templates: Public, Private, and Custom. Every event gets its own version. One profile feeds them all. Every card pulls its values from your profile, and any value can be overridden for that card only (a different title at a conference, a second phone for an event).

Card Builder steps

Step	What you set
Type and label	Public (links and socials), Private (full contact details), or Custom (minimal). Up to three cards on Pro.

Step	What you set
Profile photo	Upload or take a photo. Square or circle. Photo presence presets add motion: Gold halo, Glass lens, Float, Light sweep, Orbit ring, Editorial mono.
Background	12 presets, your own image, a video loop (up to 10 seconds), a pasted video URL, or a solid color.
Dynamic effect	Drift, Pulse, Tilt, or Living Portrait (an AI-generated loop of your photo; uses a credit).
On the card itself	Click a block to select it, drag to reorder, Move up, Move down, or Hide. Position puts everything at the top, middle, or bottom so your photo or video shows. Double-click your name, title, or any detail to edit it on the card.
Buttons	Save Contact always appears after the intake form. Choose whether it also shows on the card front. Reorder the other buttons.
Intake form	Attach a form so receivers can tell you who they are.
Publish	Choose the link slug. Update anytime; the link stays the same.

Save Contact

Downloads a vCard built from the visible fields. On iPhone it opens straight into Contacts with your photo, title, company, phone, email, and every link labeled the way you named it. Android and desktop import the same file.

Sharing

- Copy the link, or use the Share button to send it anywhere.
- Download the QR as PNG or PDF, or show it full screen at an event.
- The QR Card version is a printable white card with your photo, name, title, and QR.

3. Intake: how people tell you who they are

When someone taps "Tell me who you are," they see one large Tap to speak button and a box. They can write a sentence or say it. Goldex reads the note and shows what it understood before they send it: name, role, company, city, email, phone. If they prefer boxes, "Fill in the details instead" opens the classic form.

- Save Contact appears at the end of the form, so they share first and then save you.
- Their name must appear somewhere (in the note or the Name field). Everything else is optional.
- A consent checkbox records permission to follow up. Bulk sends through Goldex only go to people who ticked it. One-to-one messages and sends from your own phone have no such gate.
- The note lands on the contact, along with a priority (high, medium, low) and a suggested tier based on what they mentioned: sponsor, invest, book, collaborate.
- Spelling tip for receivers: say or spell an unusual name or email slowly, for accuracy.

4. Contacts: the index

The Contacts table is a spreadsheet you can talk to. Click any column name to filter by its values or sort. Click any cell to edit it in place. Tick rows and message the selection, or filter and "Message all shown."

Default columns

Name, Roles (a person can have several), City, Company, Customer status, Tier, Rating, Events met, Last contacted (automatic), Birthday. Phone, Email, State, Cost, Source, Consent, and Note are available but hidden.

Edit columns

- Rename any column. Rename or remove its choices and the change applies to every contact.
- Hide what you do not use. Reorder. Add your own columns: Text, Number, Single choice, Multiple choice, Date, Rating, Yes/No.
- Built-in columns can be renamed and hidden but not deleted, because intake, Trip Mode, and messaging use them. Custom columns delete fully.

Import

- Phone contacts, VCF, or CSV. Google Contacts once connected.
- Messy names are cleaned: "Mike Photographer ATL" becomes Mike, photographer, Atlanta GA.
- Duplicates are detected by phone or email and offered as a merge.
- Confidence gates: 85% and above files automatically, 60 to 85% asks you, below 60% goes to a review queue.
- Tag the entire import as Customer in one step. Goldex also suggests up to three columns based on the list (Industry, Referred by, Deal stage, Region).
- Imported contacts have no recorded consent. They get one-to-one sends from Goldex, or anything from your own phone.

Trip Mode

Pick a city and dates. Goldex lists everyone there, grouped by role, and suggests who to reach first based on rating, tier, and consent. Select and message.

5. Events and Event Mode

- New event: press and hold, then say the name, city, date, and which cards (public, private, or both). Release, check the chips, tap Create.
- Each event gets its own versions of the cards you picked. Tweak them for the room (a different title at a tech event) without touching the originals. Find them under Cards > Event cards, each with its own QR and link to screenshot or send to your team.
- Each event gets an intake form with an "I'm at [Event]" checkbox so submissions attach to the event.
- Event Mode is the same contact index, opened with the event filter already applied. Live counters (taps, submissions, today, consented) and a Note column. It refreshes every 5 seconds.

- "Follow up with everyone from today" opens Messages with the segment pre-selected.

6. Messages

Every send starts with a segment: a filter, an event, a picked list, or the rows you ticked. Then you choose a channel.

Channel	How it sends	Limits and notes	Where replies go
Email through Goldex	One personal email per person from "Your Name <you@mail.goldex.link>", Reply-To set to your inbox, optional BCC to you.	Free 50, Pro 1,000, Events 5,000 per month. Unsubscribe link added automatically.	Your email inbox, mirrored in Messages > Inbox.
Email in my app	Opens your mail app with everyone in BCC.	Merge fields become generic text (one shared email).	Your inbox.
Text from my phone	Goldex builds the list and message; your phone sends. Copy numbers, group text, share to WhatsApp or Telegram, or a one-by-one queue with each name filled in.	No Goldex limit. On iPhone, one-by-one sends arrive as iMessage (blue) to iPhone recipients. Group texts reply to everyone in the thread, so one-by-one is the default.	Your phone.
iMessage line (Team add-on)	A dedicated iMessage line connected in Settings. Blue bubbles to iPhones, SMS fallback for Android.	No segment limit, no carrier registration, no STOP footer required. Opt-outs are still honored. \$299 per month per sender.	Messages > Inbox.

Pace, attachments, scheduling

- Pace: All at once, Spread over 15 minutes, Spread over 1 hour, or 25 every 10 minutes. Spreading makes each message land like an individual note and keeps deliverability clean.
- Attach one image to an email or text (Pro and above).
- Send now or schedule. Merge fields: {first_name} {event} {role} {note} {card_link}.

Automations

Rules that send a template on a trigger: daily follow-up to new intake contacts, birthday, event update, 90-day re-engage for Gold contacts, trip alert. Automations only reach contacts with recorded consent.

Inbox

Replies to anything sent through Goldex. Each is read as Interested, Scheduling, Question, Not interested, Wrong person, or STOP. Reply from the row.

7. NFC tags

- My Tags lists every tag: ID, short link (goldex.link/t/ID), what it opens, status, scans.

- Order stickers (5, 10, 25, 50) or write your own. Any tag can be re-aimed at a different card or event at any time.
- Tags activate on delivery or first tap. Disable a lost sticker in one click; it shows "not active."
- Scans are anonymous. A contact is linked to a scan only when they submit the intake form.

8. Plans and limits

	Free	Pro \$12/mo (\$120/yr)	Team \$49/mo
Cards	1	3 (Public, Private, Custom)	3 per seat
Events	1	Unlimited	Unlimited
Contacts	100	5,000	25,000
Emails / month	25	1,000	5,000
Texts	From your phone	From your phone	From your phone, iMessage line add-on
AI actions / month	100	2,000	10,000
Living Portrait	No	Add-on	1 / month
Seats	1	1	5
Footer on card	Yes	No	No

Add-ons: Living Portrait, 3 for \$15. iMessage line \$299 a month per sender (Team). Founding offer: first 500 members get Pro for \$99 the first year.

9. Your data

- Your contacts belong to you. Goldex staff cannot open your index: access is locked to your login at the database level.
- Nothing is shared between members. Receivers see only the card you publish.
- Export everything as CSV from Settings at any time. Delete your account and every row goes with it.
- The assistant reads your data only to file it for you. It is never trained on your contacts.
- Consent is recorded through the intake form with a timestamp. You can record an opt-out on any contact.

10. Good habits

- Rate people the same day. Rating drives Trip Mode and re-engage automations.
- Follow up within 24 hours of an event. "Follow up with everyone from today" exists for this.
- Keep one Main card live for the sticker on your phone, and one card per event.

- Use one-by-one sends for anyone you want a reply from. Use email or paced sends for updates to a crowd.
- Import your customer list and tag it Customer. Your index then covers everyone, not just event contacts.
